

Clients with Mental Illness & Substance Abuse Disorder by RSN.

Operational Definition: Percent of mental health outpatient clients who had both a mental illness diagnosis and a substance abuse diagnosis and/or substance abuse impairment in the Fiscal Year by RSN.

Operational Measure: Number of outpatient recipients who had a mental illness diagnosis and a substance abuse diagnosis or substance abuse impairment during the Fiscal Year divided by the total number of outpatient recipients in the Fiscal Year.

Formulas:

Number of outpatient recipients who had a mental illness diagnosis and a substance abuse diagnosis and/or impairment in the Fiscal Year by RSN

Number of clients receiving community outpatient services in Fiscal Year by RSN

Discussion: This indicator shows the percentage of outpatient mental health service recipients who have both a mental illness and substance use disorder. The percentage of outpatient mental health service recipients who have both a mental illness and substance use disorder has increased over the 3 years.

Data Notes:

- All Diagnoses are reported using the ICD-9 classification.
- A substance abuse disorder is identified by using two data elements from the January 2002 Data Dictionary: (1) Diagnosis of substance abuse and/or (2) Impairment kind of “D” at any time in the FY.
- A person's diagnosis is determined by taking the most recent diagnosis and applying a precedence table to pick one diagnosis. A mental illness diagnosis includes all mental illness diagnoses except dementia, mental retardation, autism, or personality disorders.
- The RSN count shows the number of unduplicated clients within each RSN (i.e., one person is counted in each RSN in which they received services).
- The Statewide counts show the number of unduplicated clients across RSNs (i.e. even if a person receives services in more than one RSN, they are only counted once in the Statewide total).
